- To actually run OpenMM, you need to invoke a Python script.
- To invoke the script, enter the following commands
 - `cd ~/Desktop/OpenMM', which changes your current directory to the directory where the files are
 - 'Is' lists the contents of the current directory. It isn't 100% necessary but useful to check.
 - `python MD_ubq.py' actually runs the script

```
(openmm) Minh-IIT-MBP2018:[~]: cd ~/Desktop/OpenMM
(openmm) Minh-IIT-MBP2018:[~/Desktop/OpenMM]: ls
1ubq.pdb MD_ubq.py
(openmm) Minh-IIT-MBP2018:[~/Desktop/OpenMM]: python MD_ubq.py
```

- When you run the script, you will see some output to the console. This is mostly from the StateData reporter
 - Notice that the potential energy goes slightly up. This is because we started with a minimized structure.
- If you type `ls' again, you will see that the simulation created two files
 - ubq_mod.pdb the model that includes hydrogen but not water
 - trajectory.dcd the actual simulation data

```
(openmm) Minh-IIT-MBP2018:[~/Desktop/OpenMM]: python MD_ubq.py
