How are virtual screening program assessed?

 Binding poses Similarity of predicted poses to solved structures Root mean square deviation (RMSD) < 2 A considered good inactive compounds
decoys, which are have similar chemical properties but different connectivity than active molecules
Quantified by receiver operating characteristic (ROC) curve, area under the ROC curve

Correlation between scores and measured affinities

Active molecules should have lower scores than

Docking scores

(AUC), enrichment factor

 Computational chemists, especially methods developers, tempted to tweak approach (e.g. parameters) until experiments are reproduced. Blinded challenges (e.g. D3R Grand Challenge) reduce bias

Reported values can be biased

How are virtual screening program assessed?

- Binding poses
 - Similarity of predicted poses to solved structures
 - Root mean square deviation (RMSD) < 2 A considered good
- Docking scores
 - Correlation between scores and measured affinities
 - Active molecules should have lower scores than
 - inactive compounds
 - decoys, which are have similar chemical properties but different connectivity than active molecules
 - Quantified by receiver operating characteristic (ROC) curve, area under the ROC curve (AUC), enrichment factor
- Reported values can be biased
 - Computational chemists, especially methods developers, tempted to tweak approach (e.g. parameters) until experiments are reproduced.
 - Blinded challenges (e.g. D3R Grand Challenge) reduce bias

The Receiver Operating Characteristic (ROC) Curve

score	fraction of actives	fraction of inactives
-53.4	0.2	0
-50.2	0.2	0.2
-49.2	0.4	0.2
-45.7	0.6	0.2
-42.1	0.6	0.4
-35.2	0.6	0.6
-30.0	0.6	0.8
-21.3	0.8	0.8
-20.7	1.0	0.8
-4.2	1.0	1.0
