What is virtual screening and why is it used?

 use of computation to estimate the activity (e.g. binding or inhibition) of a database of chemical compounds against a target • "virtual" in contrast to experimental high-throughput screening (HTS) usually based on molecular docking, but machine learning in vogue

Virtual screening

 faster predictions of specificity compared to HTS • cheaper, accessible to academic laboratories can screen larger libraries, increasing likelihood of good hit HTS suffers from pan-assay interference compounds (PAINS)

to help obtain leads for drugs and chemical probes

prioritizing compounds for experimental follow-up

Why is it used?

What is virtual screening and why is it used?

- Virtual screening
 - use of computation to estimate the activity (e.g. binding or inhibition) of a database of chemical compounds against a target
 - "virtual" in contrast to experimental high-throughput screening (HTS)
 - usually based on molecular docking, but machine learning in vogue
- Why is it used?
 - to help obtain leads for drugs and chemical probes
 - prioritizing compounds for experimental follow-up
 - faster predictions of specificity
 - compared to HTS
 - cheaper, accessible to academic laboratories
 - can screen larger libraries, increasing likelihood of good hit
 - HTS suffers from pan-assay interference compounds (PAINS)

Single Docking	Library Screen		
Use GUI	Use scripts		
Data in one directory	Data in tree structure		
Single ligand PDBQT	Several ligand PDBQT		
One interactive calculation	Submit jobs to cluster		
Visually inspect all results	Visually inspect best results
